TITLE: On the feasibility of using quick forming prostheses from rapidly
polymerizing methyl metacrylate under field conditions

SOURCE: Lekarz wojskowy, no. 7, 1966, 605-608

TOPIC TAGS: dentistry, dental equipment, methylmethacrylate, polymerization rate,
synthetic material

ABSTRACT: The authors discuss the use of rapidly polymerizing prostheses from methyl
metacrylate. The use of these protheses in dentistry and, in particular, in dental
surgery during extraction of teeth is discussed. Its simplicity in terms of rapid
polymerization makes the use of these materials feasible for taking mouth impressions
for formation of partial or total bridges, without the use of complicated and ex-
pensive instruments. As an example of the efficiency of these protheses the authors
cite 300 cases in which only 2 cases required further intervention in the process of:

healing tooth extraction cavities. The properties of the polymer and its anti-bacterial activity, as well as the absence of swelling due to the polymer and its effect on the mechanism of blood coagulation are discussed. It is concluded that the application of rapidly forming prostheses should be treated as a problem of the near future in stomatological stations, both in peace and in war.

Warsaw, Farmacja Polska, Vol 22, No 9, September 1966; pp 653-658

Abstract: Intravenous injection of 4 mg/kg of chlorpromazine or 3 mg/kg of levomepromazine induced statistically significant rise in glycemia and potentiated hyperglycemia induced by epinephrine; it had no effect on insulin hypoglycemia nor on norepinephrine or glucose hyperglycemia. The body temperature of the animals decreased slightly following injection of the two drugs. 3 tables, 2 graphs, 2 Polish and 11 Western references.

✓ Experiments on sorbose. Józef Jełka, Franciszek Kokot, Leonty Samochowicz, Józefin Binkiewicz, and Jan Chelmicki (Zakład Farmakol. Kptn. Ślaskiej Akad. Med., Zabrze-Rokitnica). *Acta Polon. Pharm.*, 11, 285-294 (1954).—Guinea pigs, 250-400 g. body wt., in which scurvy developed by feeding a special vitamin C (I)-deficient diet, died in spite of the supplementary feeding of 5-20 mg. sorbose (II)/100 g. body wt. It is not a precursor of I in guinea pigs. Men (15) and dogs (20), after administering II in the amt. of 0.25-1.00 g./kg. body wt. (to men orally and to dogs orally and by intramuscular injection, & 10% II soln.), showed only a slight increase of blood-sugar concn., about 10 and 20 mg. %, resp. However, after administering II by intravenous injection to dogs (with 20% II soln.) the blood-sugar concn. increased rapidly about 100 mg. % and remained at this level for approx. 3 hrs.; only after this period of time first traces of II appeared in urine. The amts. of II not assimilated by men and dogs averaged 11.1 and 10.2% of the II administered, resp. The degree of assimilation of II administered to dogs did not depend on either the manner of supplying II or on the size of the dose used (within the limits of 0.25 and 1.00 g. II/kg. body wt.). The amt. of I excreted in urine and the concn. of blood I were not affected by the administration of II or glucose. II had no effect on blood pressure, respiration, or diuresis as found in dogs and rabbits. II also had no pharmacol. effect on the isolated intestine and matrix of guinea pigs. II was toxic in the amt. of 10 g./kg. body wt. and above; the lethal dose was 30 g. II/kg. R. Wierblek

Effect of a single infusion of dextran upon renewal of blood-serum proteins in bled dogs. Franciszek Kokot, Józef Jeske, and Jan Chelenin (Zahl. Farm. Wrocław). *Acta Polon. Pharm.* 13, 199-204 (1936) (English summary).
The quantity of dextran transfused into thoroughly bled dogs was equal to the vol. of drained blood. The expts. disclosed that dextran does not retard the renewal of the total quantity of blood-serum proteins. The proteins reached the initial level at approx. 120 hrs. after the infusion; although the level of total proteins was the same after 120 hrs., the

proportion of α -, β -, and γ -globulins was significantly different.

Bratislava, Biologia, Vol 21, No 6, 1966, pp 405-420

Abstract: A mixture of microelements B, Mn, Cu, Zn was used in experiments in a green-house. The sugar beet was Beta vulgaris L. var. Saccharifera, strain Dibrovce N(Semcice). The experiments were conducted in sand to which the microelements were added and a solution of basic nutrients supplied. Control plants were given only the solution of basic nutrients. During the overall period of vegetation the photosynthesis of the plants receiving the microelements was 10-20% higher on sunny days. When sun was not shining the photosynthesis was the same, or 5-7% lower than that of the controls. The highest intensity of

Fesmanowicz, L. On the Cesàro means. Studia Math. [2],
1951, p. 158 (1951).

Let $\{x_n\}$ denote the n th Cesàro means of order α of the series $\sum a_n x_n$. The author proves the following results. (I) If $a_n = o(n^{\beta})$, $\alpha + 1 > 0$, $\beta + 1 > 0$, then the sum of $\sum a_n x_n$ is summable (C, α) for $\alpha < \alpha + 1$. (II) Under the hypotheses in (I), $\sum a_n x_n$ is either summable (C, α) or not summable by any Cesàro mean. (III) If $\sum a_n x_n$ is summable (C, α) to zero, where $\beta + 1 > 0$, $\alpha + 1 > 0$, then $a_n = o(n^{\beta})$, where $s = 0$ for $\beta \geq 0$. These are refinements on previously known results in which the hypotheses on α and β were more

TITLE: Structure of Real Crystals III. Dislocations

PERIODICAL: Fizikai Szemle, 1960, Vol. 10, No. 11, pp. 340-347

TEXT: This is the third part of reports of a working group of the Hungarian Academy of Sciences, assigned to research on crystal growth. The authors of this paper expose the theory of dislocations on the basis of standard text books and other literature and report on their own experiments confirming the theory. Definitions and characteristics of the different kinds of dislocations - marginal or linear (Taylor or Orowan), torsional (Burger) - are given with reference to the more exact treatment of this matter in textbooks of Cottrell and Seeger. For the critical shear stress producing displacement in marginal dislocation, a formula of Peierls is quoted. The shear stress field of torsional dislocation is calculated and demonstrated by the authors' micrograph. For the origin of dislocations, several concepts based on crystal growth are presented. On dislocations in plastic deformation, the multiplication

Card 1/3

Structure of Real Crystals III. Dislocations

H/016/60/000/011/003/003
B009/B057

mechanism of F. C. Frank and W. Ried is explained. According to this, a great number of dislocations is necessary to produce plastic flow. Methods of detecting dislocations are explained: the decoration (electrolytic) method, etching with chemicals or by thermal evaporation. The electron-microscopic and the X-ray method are not treated in this communication. Regel' and coworkers are credited for tests on almost 50 materials, published in their comprehensive text book (*Kristallografiya*, Ref. 20). 6 micrographs of the etching tests of the authors and one coworker are presented in Figs. 11-16. Finally, the authors point out the applications of the dislocation theory. Numerous physical characteristics: critical shear stress, yield point, ageing, work hardening, internal friction, endurance strength, creep, brittleness etc. are explicable by dislocation. Dislocations have an important influence on crystal growth according to latest theories of W. Burton, N. Cabrera, F. Frank, and A. Verma (Refs. 27, 28), further on electrical, magnetic, optical and chemical properties of materials. Jogs are active places in connection with plastic deformation. Investigations of the Hungarian Academician Z. Gyulai (Ref. 36) on pressure effect are often referred to. C. Gallagher reported on crystalline solids to the Conference in Bristol (1954, Ref. 38). Dislocations figure large

TITLE: Certain observations on the growth and mechanical properties of whisker crystals of NaCl
PERIODICAL: Kristallografiya, v.7, no.3, 1962, 433-436 + 1 plate
TEXT: Whisker crystals of NaCl were grown by the methods of S.Amelinskx and C.C.Evans. A saturated solution of NaCl was run into a sheet of cellophane supported on an aluminium frame. The frame was put into a beaker at the bottom of which was a cup of saturated solution. The beaker was covered to make evaporation very slow. Whiskers grew on both sides of the cellophane to a length of 3 cm at a rate of about 5 to 10 mm/day. At the end of each crystal there was usually a thickening. Fine canals were observed to run through the needles. A new method of growing whiskers from a seed is described permitting the preparation of crystals up to 20 cm long. It is shown that whisker crystals are twisted about their lengths with a period of 1/2 to 40 mm. This corresponds to a Buergers vector of 40 to 240 Å. The faces of the whisker crystal were perpendicular to each other and the cross-

El32/E460

Certain observations on ...

section was often rectangular with a ratio of up to 10:1. When fresh the side faces are smooth but after two weeks standing they become rough and covered with tiny cubic crystallites. Thickened places are often formed where two fibres cross. The maximum twisting of whiskers was noted and it was found that the elastic twisting possible is 10 times greater than that for usual NaCl crystals and corresponds to a maximum stress of 8100 g/mm². Great plasticity in twisting is found at room temperature and may reach 10%. The form of a whisker very greatly bent under its own weight when held by one end was plotted but could not be treated analytically. Acknowledgments are expressed to Professor Z.Gyulai for advice. There are 9 figures.

Title : Negative Absolute Temperatures

Orig Pub : Fiz. szemle, 1958, 8, No 8, 250-253

Abstract : The article is devoted to an explanation of the physical meaning of negative absolute temperatures (NAT). By definition, a certain body or a certain system will have a NAT if it is heated to so high a temperature, that a further increase in the temperature no longer leads to an increase in the internal energy of the body or system. Quantitatively, the transition to NAT can be understood from an examination of the behavior of the entropy system. An ordered system has an entropy of zero; an increase in the temperature increases the entropy,

JESZENSKY L. Kiserletek uj tuberculinszeru prophylacticusan hato anyag eloallitashoz
Experiments for the production of a new tuberculin-like substance with prophylactic action
Orvosi Hetilap, Budapest 1948, 89/20 (316-317)

The unsatisfactory action of tuberculin, when used prophylactically and therapeutically, may be due to the production of tuberculin from cultures grown on artificial media. The antigen for the author's experiments was produced by maceration in saline of caseous human pulmonary tissues, removed at autopsy. This was passed through a fine Berkefeld filter and carbolic acid in 0.50 o/o concentration was added. Experiments were carried out with this substance on ten guinea-pigs. The first injection, subcutaneously in the inguinal region with 0.10-0.20 ml., was followed by two further injections of 0.40-0.50 ml. at two to three-week intervals. These guinea-pigs, and as a control, one untreated guinea-pig, were injected in the inguinal region with a freshly prepared suspension of human, ftubercles, bacilli. The control animal died of generalized tuberculosis after four weeks, the other animals survived for approximately four to six months and though finally they did die of generalized tuberculosis, the lesions showed dense and extensive fibrosis.

Title : On the Mechanism of Growth of NaCl Crystals.

Orig Pub : Acta phys. Acad. sci. hung., 1957, 8, No 1-2, 147-160

Abstract : The author investigates the surfaces of the natural and synthetic NaCl crystals (I) grown from a melt and from a solution. In microscopic observations of the surface of polycrystalline plates of I, formed on the surface of a rapidly cooling melt, there are observed spiral forms of the growth on the boundaries of the individual blocks. Photographs are given of new etching figures on surfaces of I. It is indicated that the most readily etched are crystals from melts. For natural crystals it is necessary to have a longer etching. As a result of etching, various types of spiral growth forms have been obtained (round,

Abstract : A study of the surface of natural and synthetic NaCl crystals grown from melt and solution. Microscopic observations of the surface of polycrystalline plates of NaCl formed upon the surface of rapidly cooling melt, revealed spiral forms of growth at boundaries of individual blocks. Photographs are shown of new etching patterns on NaCl surface. Crystals derived from melt are most readily etched; natural crystals require more prolonged treatment. As a result of etching tests different kinds of spiral forms of growth were obtained (circular, quadrangular, twinned, etc.), which are similar to spirals of crystal growth from vapor and solution. It is pointed out that spiral growth plays an important part in growth of crystals from a melt. -- I. Kamentsev.

Abstract [Author's English summary modified]: 58 boys were examined by the author between 1963-1965; they were referred to the clinic by various branches of law enforcement agencies. The developmental aspect of adolescence is the most striking feature of infantile syndromes. The author describes in detail 6 cases where he recommended that criminal prosecution should be suspended. In all of the cases the criminal behavior was due to mental disturbance and the patients were hospitalized to receive the required treatment. Only very young patients could be treated successfully as out-patients. Special institutions for treatment of juvenile delinquents are recommended. 2 Figures, 12 Western, 12 Czech references. (Manuscript received 20 Jul 65).

*Doświadczalne badania nad płynem przedniej komory oka w zapaleniu tęczówki po zastosowaniu antystyny i szczepionki durowej. Investigations on the influence of the aqueous humour on the frog's heart in iritis treated with antistine and typhoid vaccine POST.

OKULISTYKI 1954, 1 (57-68) Graphs 7 Tables 2

Antistine and typhoid vaccine were used as provocative agents and its activity was tested on the frog's heart. The frog's heart was observed subjected to the injection of the aqueous humour taken before and after the treatment with the drugs mentioned. The experiments with antistine were negative, that with typhoid vaccine showed mutual relations, perhaps because of mobilizing ACTH. The symptoms were similar to blocking of the parasympathetic bodies.
